

`inventory` app — Dashboards, Access Hub & Glue (no tables of its own)

Dual-register guide. RBAC truth: docs/production/RBAC.md · [ADR-0003](#).

Purpose & business responsibility

Historical naam “inventory” hai, par aaj yeh app **composition + access** ka ghar hai: dashboards (owner/manager/worker views), the Access Control hub, role editor, sidebar gating middleware, and the tracking-section views. **Zero models** — `Role` / `SidebarItemRule` relocated to `accounts` (2026-06); `inventory/models.py` sirf re-export karta hai taaki purane imports na tootein.

What tables are created

None. (Re-exports only.) `signals.py` is an intentional tombstone explaining WHY signals are banned (ADR-0001) — padho, samajh aa jayega.

How data flows through this app

```
request → SidebarAccessMiddleware (menu item hidden ⇒ its URL ALSO blocked)
        → view (dashboard/access-hub/tracking section)
        → reads via services (permission_service, payroll_service, models' read helpers)
        → renders. WRITES: none of its own – role edits call accounts services.
```

Why this design: menu and URL gating share ONE rule source (`SidebarItemRule`) — “dikh nahi raha to khul bhi nahi sakta.” Worker dashboard isolation: own active stages via `filter(worker_tasks__worker=user, status__in=ACTIVE)` — assignment truth, skill alone is not enough (V2-1c-iv).

What breaks if bypassed: a view added without a sidebar rule is reachable by URL while invisible in menus — the whitelist bug class (fixed 2026-06-02); always register the rule.

Views (the interesting ones)

`views/dashboard.py` — role-aware home (worker: active Addas + report badges; management: ops summary) · `views/access_hub_views.py` + `role_views.py` — Access Control hub (roles, skills, per-user) · `views/sidebar_access_views.py` — menu/URL rules · `views/tracking_*` — barcode dashboard/export/history sections · `middleware.py` — the URL-enforcement half of the sidebar.

Common mistakes

1. No raw `is_superuser` checks — `permission_service` only (rule 6).
2. New menu item without `SidebarItemRule` = unprotected URL.
3. Don't resurrect signals here; the tombstone stays.

Django Learning Notes

- **Middleware:** ek hi jagah pe har request ka gate — yahan sidebar rules URL-enforcement bante hain.
- **Context processors** (`context_processors.sidebar`): har template ko menu data automatically — views ko repeat nahi karna padta.
- **Re-export shim** (`inventory/models.py`): refactor ke baad backward compatibility ka sasta tareeka — imports kaam karte rehte hain jab tak call-sites migrate na ho jayein.

Related ADRs: 0001 (no signals) · 0003 (RBAC).

Real factory example

Worker Two login karta hai → middleware sidebar rules check → usse sirf Dashboard + My Earnings dikhta hai → dashboard pe “● Report needed” badge (uske ACTIVE task se) → tap → report screen. Manager wahi URL kholta hai to poora ops view — same app, role-aware composition.
