

Financial truth & settlement — the heart

The ledger (WorkerLedgerEntry)

Append-only. Credit = paisa bana; debit = paisa gaya/recover hua. Galti = OPPOSITE-direction REVERSAL row (entry_date copied — month ka total sahi netting karta hai). UPDATE/DELETE kabhi nahi. Balance = SUM, hamesha live.

Settlement = approval event, NOT payment (Model A)

AddaSettlement finalize: “is Adda ka kaam check ho gaya — earnings book karo, advances me se YEH wale recover karo.” Cash baad mein, alag event (PayrollSettlement, payment-only).

The lifecycle (and the correction story)

draft (scratchpad) → FINALIZE (money writes, frozen per-worker items) → galti? REVERSE (compensating rows; SWA void; PSI stamped) ya REVERSE & SUPERSEDE (successor draft, chain visible: ADST-0001 → 0002 → 0003). History kabhi edit nahi hoti — kal ki galti aaj ke naye events se theek hoti hai. Live-proven on dev with real chains.

The guards you will meet in code

- settled line dobara settle nahi hoti (era-A + era-B skip classes, labeled in the draft UI);
- reopen of a settled stage REFUSES, ADST naam le ke;
- void on a settlement line REFUSES → “reverse the settlement”;
- recovery ≤ remaining, under lock;
- finalize lock order (see [03](#)).

Eras (ADR-0007 — executed)

Era-A = purana allocation-time crediting (SWA.adda_settlement NULL) — readable + reversible forever, population frozen since V2-3. Era-B = settlement lines. Lever:

`LEDGER_CREDIT_AT_ALLOCATION` (default False; env True = tested rollback). Deletion PR soaked.

Worker's three numbers

Expected (unsettled, frozen WSC) → Earned (ledger) → Paid (cash). Non-overlapping by construction — tests prove the rupee never shows twice.
