

Costing — two measurements, one labor (NEVER add them)

The duality (ADR-0009 — the #1 trap)

`processing_cost` = STANDARD cost: $\text{ws.cost_rate} \times \text{handler quantity}$, role-independent, frozen at stage advance. Settled earnings = ACTUAL pay: $\text{role-aware frozen rate} \times \text{reported/verified qty, ledger}$. Payable stage ke liye yeh EK hi labor ke do measurements hain → **kabhi add mat karo.**

Full Adda cost = material (G1) + ACTUAL settled labor + `processing_cost` of NON-payable stages only (+ future overhead, era-stamped). Standard-vs-actual ka difference = future VARIANCE report — component nahi.

Labor-source rule

Per-Adda actual labor = Σ non-voided SWA snapshots (both eras). `WSC.expected_*` se nahi (era-A drop ho jata), settlement totals se nahi (partial/reversed chains mis-sum).

Honest-NULL

Unpriced stage / unpriced roll = NULL, kabhi 0 nahi. Dashboard banner + per-Adda counts chillate hain “material costing incomplete”. Unknown ≠ free.

Grouped stages

`cost_billed_at` = member ka cost payer stage pe bill hota hai. C-1 guard: grouped member kabhi earning rate nahi deta (role-rate ho tab bhi ₹0 freeze) — warna double-pay. Era-A allocation bhi grouped stages refuse karta tha; ab settlement side bhi.

Material (G1 future, facts already captured)

$\text{cost_per_kg} = \text{PURCHASE fact (corrections only)}$. Consumption = attach weight – leftovers (mandatory weigh-ins). Leftover reuse = `consume_leftover` ONLY — off-book reuse permanently understates the next Adda's cloth cost.
