

LEARNING PATH — from zero to productive (developer or owner)

Order matters. Each step: what to read + what to DO on the dev server. Deep-dive topic lessons live in [docs/LEARNING/](#). Estimated: developer ~2 days to productive · owner ~4 short sittings.

1. Business domain (½ sitting)

Read: [GLOSSARY.md](#) → [ERP MASTER CONTEXT.md](#). Do: open the dashboard as manager; click into one Adda.

2. The map (½ sitting)

Read: [PROJECT KNOWLEDGE MAP.md](#) — all of it. Do: trace one click (worker report submit) through its §2 request flow.

3. Adda lifecycle (1 sitting)

Read: [LEARNING/08 ADDA LIFECYCLE.md](#) + [production/OVERVIEW.md](#) + [STAGE_FLOW.md](#). Do: start a fresh Adda on dev, walk it to barcode generation.

4. Production truth (1 sitting)

Read: [LEARNING/05 PRODUCTION TRUTH.md](#) + [ARCHITECTURE_V2.md](#) (skip §11 for now) + [config/production/README.md](#) status card. Do: assign yourself, report on a phone-sized window, complete; leave one worker unreported and watch the completion warning (P2).

5. Financial truth + settlement (1–2 sittings — the heart)

Read: [LEARNING/06 FINANCIAL TRUTH AND SETTLEMENT.md](#)

- ARCHITECTURE_V2 §11 + ADR-0005/0007 + [config/expense/README.md](#). Do: settle your dev Adda; reverse & settle again; watch the chain + ledger rows; pay cash. Note Expected/Earned/Paid moving without overlap.

6. Tracking & identity (½ sitting)

Read: [config/tracking/README.md](#) + [production/TRACKING.md](#). Do: open an Adda timeline; print a QR sheet.

7. Costing (½ sitting)

Read: [LEARNING/07 COSTING.md](#) + [ADR-0009](#) — especially NEVER-ADD. Do: find an un-priced roll/stage; see honest-NUL on the costing dashboard.

8. Future roadmap (½ sitting)

Read: [ROADMAP REVIEW POST C1 2026 06 11.md](#)

- ADR-0008/0010 (the fences future phases inherit).

9. Django architecture as used HERE (1 sitting, developer)

Read: [LEARNING/01 DJANGO CONCEPTS.md](#) → [03 TRANSACTIONS AND LOCKS.md](#) → [04 SERVICE LAYER.md](#) + SYSTEM_DESIGN §6–7. Then read these five files top-to-bottom — they ARE the architecture: `worker_task_service.py` · `adda_settlement_service.py` · `ledger_service.py` · `cost_service.py` · `production/services/_shared.py`. Do: run `bash scripts/check.sh`; break a single-writer rule in a scratch branch and watch gate 4b/4c fail.

10. SQL (parallel track, any time)

Read: [LEARNING/09 SQL BEGINNER TO ADVANCED.md](#) — levels 1–9 on this project's real tables. Do: `manage.py dbshell`, run the Level-3 balance SUM, then `print(qs.query)` on any queryset.

Owner shortcut

Steps 1 → 3 → 5 + the My Earnings/settlement screens = enough to RUN the factory. The rest deepens at your pace.
